Social anxiety disorder among older Chinese adults: prevalence and demographic correlates. Little information exists on the epidemiology of social anxiety disorder (SAD) in the older adult population. We examined the prevalence, symptoms, and associated demographic variables in a sample of older adults. Participants were 510 Chinese adults (mean age = 68.4 years) recruited from community venues in Hong Kong. Participants completed a structured interview assessing the DSM-IV-TR criteria for SAD. About 13% of participants met the criteria for SAD; anxiety, avoidance, and functional impairment were moderately strong. The most common subtype of SAD was the fear of negative evaluation (65%), followed by the fear of negative self-evaluation (26%). Older adults who were younger, single, less educated, who had lower social support, and were poor were more likely to meet criteria for SAD. The high prevalence of SAD and the high comorbidity with major depression in older adults have significant public health implications.
