Its main competitor is called CPU Manager and it actually does the exact same thing, but there are a few differences that may be valuable depending on your needs. The interface is a bit different, the app doesn't give you the benefit of a detailed help manual and some new features are not available in the free version, like the in-app browser. Still, CPU-Control is the first choice for users who want to run several applications at once, and it comes with a large number of settings that can be easily accessed thanks to its interface. With that said, I think it's fair to say that CPU-Control is the king of CPU manager, but if you feel the urge to have a second opinion, read my review of CPU manager.
