Though I'm a designer first and foremost, I've used Photoshop extensively to alter my client's projects. \* \* \* # Scanning analog art With the advent of the digital age, traditional media have been turned over to the computer. There is no doubt that scanning and digital image creation has revolutionized the communication of art. The quality of a digital reproduction is usually unsurpassed. You can scan directly to file or to a DVD or CD. When scanning analog works, many scanners, including Canoscan 3500 and some LightScanners, will allow you to use a DVD or CD instead of a paper roll for the scan. However, if you opt to use an external scanner to create files, you can use your scanner directly to media, but you can also use the USB output of your scanner. If you opt to use an external scanner to create files, you can use your scanner directly to media, but you can also use the USB output of your scanner. \* \* \*

1. Field of the Invention The present invention relates to an inkjet printhead having a plurality of pressure chambers, each having a pressure generating device, a channel for a movable quantity of ink, formed in a thin plate and communicating with each pressure chamber, and a valve for closing an ink supply port for supplying ink to the channel. 2. Related Art In recent years, in the field of printing, various types of inkjet printheads have been developed, and mainly used in an inkjet printing apparatus of a type that prints by discharging ink from nozzles provided at the printhead. In an inkjet printing apparatus of this type, a predetermined amount of ink (quantity of ink to be discharged) is supplied from an ink tank to a printhead and then discharged onto a printing medium from the nozzles. After that, the printing medium is moved and a new area is printed. That is, the nozzles discharge a fixed quantity of ink at a constant timing, and the ink is supplied to the nozzles in one direction. However, for printhead in which ink is supplied from a tank and discharged through nozzles, in the case where there is a variation in a quantity of ink to be supplied from the tank to a printhead, a change in an amount of ink to be discharged, or a change in a discharge timing, there has been a problem that a density variation and image distortion due to unevenness of the ink may occur. Further, in an inkjet printhead in which ink is supplied from a tank and discharged through nozzles, in the case where the diameter of a nozzle or the length of a nozzle passage varies with a change in ink to be supplied to the printhead, there has been a problem that the amount of ink to be discharged from the nozzle, the print quality, and the life of the nozzle vary with the change. To address the above problems, in Unexamined Japanese Patent Publication No. 2005-184075, a new inkjet printhead structure in which a pressure chamber and a nozzle passage are formed in a common chip, the diameter of a nozzle is determined by the space between a plate having pressure generating devices and a plate having the nozzle passage, and ink is supplied to the pressure chamber through the nozzle passage is disclosed. In Unexamined Japanese Patent Publication No. 2008-71543, a technique for adjusting the diameter of a nozzle by changing the width of a nozzle passage in a

Q: Find the character position of next C character given an index of a character I have a char[] array, let's assume that it contains the following text: "My\_name\_is\_Bob" What I want to find out is the index of the character of "Bob". The arrays length is much higher. Here is the code that I am using: char[] name = "Bob"; int start = Arrays.asList(name).indexOf(name, 0); int end = Arrays.asList(name).indexOf(name, start + 1); System.out.println("start = " + start + "; end = " + end); I am getting: start = 2; end = 1 I am totally puzzled. How can the index of the character 'Bob' in the previous example be 1? I would expect: start = 0; end = 2 There is a logic error in my program somewhere. A: There are two problems with your code: The String#asList(char[]) method returns a List, where the first parameter of List#indexOf(Object, int) expects you to give it a char, not a String. You are simply indexing from 0 to the length of the String, which is 1, so you are correctly getting the position 2. The method String#indexOf(int, int) returns -1 if the requested position is not a character in the string. So you should check that first. If the position is in the string you pass, the method returns the index of the character in that string, which is the index of the last occurrence of the character, so you should also check that. Note that the method returns -1 if the character position is not inside the string; it does not stop searching from there. If you know it is in the string, you might as well use: int start = name.indexOf("Bob"); int end = name.indexOf("Bob", start + 1); As pointed out by Cawas points out, the method also returns the index of the first occurrence if the position is after the last character, so you should check that: int end = name.indexOf("Bob", start + 1) + 1; // or add 1 if you really want the index A
