Umlaut

The Umlaut application is not an ordinary typewriter. It will help you improve your grammar by inserting umlauts automatically whenever you type. In fact, umlauts are used in a large number of languages, so by typing only a few letters, you'll be able to change the entire text. The umlauts are like the characters of the German language, but they use only three keys. To type one of them, you will need the AltGr key. In fact, in most cases, it will be the only letter you will need to type in order to type a umlaut. For example, Ä will be typed as AltGr + A, Ö will be typed as AltGr + O, and Ü will be typed as AltGr + U. If the umlauts need to be typed in the upper or lower case, the uppercase letter will require AltGr + Shift + the letter upon which the umlaut is based, while the lowercase umlauts will be typed by pressing AltGr + Shift + the letter. When typing your texts, the application will make the change in your current text. For instance, if you are writing text with a German accent, the application will automatically include the right umlaut. If you type an a in an English text and decide to replace it with an o, the entire text will be changed accordingly. However, the application is not very useful if you are a German or Austrian. Even if it is easy to type the umlauts using the AltGr key, the keys you will use to type the symbols won't match the ones used to type them in the language you speak. Therefore, we have developed an application that will make it possible to type umlauts while using the keys that are specific to your own language. It is called Umlaut. Why install Umlaut? Umlaut is an application that will help you type the umlaut in the German language. It is a tool that, by using the AltGr key, will automatically change your text with the right umlaut. This application will only work in combination with a German keyboard that uses the AltGr key. Most keyboards that use the Standard (US) keyboard layout use the AltGr key, while other layouts use other keys. Why is this a feature of German keyboards? As you might have heard, there is no such a thing as a German keyboard. Everyone has a keyboard with keys
