The first round of the 2018 NFL Draft is in the books, and the results were mixed. The Patriots cleaned house in the draft by choosing three players with the first three selections in the draft, and the result was two first round quarterbacks and a linebacker. Passing on Sam Darnold in favor of Josh Allen was the biggest upset in the first round. Although he isn't an elite quarterback, Darnold is highly productive when healthy. He's a dangerous playmaker and owns a positive record in the clutch. Expectations have been high for him ever since he was mocked to the Jets at No. 3 overall in the 2017 NFL Draft. As expected, the Cowboys took the best player available with the No. 4 pick, but it took a little while for someone to grab him. The Los Angeles Chargers took Tua Tagovailoa at No. 13. He couldn't hold on to the first overall selection, but he was still the first quarterback off the board. What do you think of the first round of the 2018 NFL Draft? Let us know in the comments below!Q: How do I detect tty on netcat? I'm trying to write a Python script that listens for the /dev/tty port and that opens said port, if there is already something there. This can be done with linux netcat (nc), but how do I detect if there is tty there? A: You can use netcat -e to listen for the device and create a pipe to read for the tty-ness. c = netcat.open() c.setsockopt(socket.SOL\_SOCKET, socket.SO\_REUSEADDR, 1) for line in c.recvfrom(1024): if not line or line.startswith('#'): continue print(line) if line.startswith('tty'): # Do something with the tty If you wanted to keep the original connection open you could have netcat not terminate the stream with the -q flag or you could send a break, such as CTRL-C to shut it down. A: From reading the source for netcat (Linux version, not sure if this is the same for other platforms

In the manufacture of glass fiber strands and, more particularly, in the manufacturing of glass fiber strands that are used as reinforcement in reinforcing plastic matrices, such as polyvinyl chloride, it is desirable that the formed glass fibers have as low a coefficient of friction as possible. Silica-based glass fibers are typically manufactured by attenuating a stream of molten glass through a plurality of small, fine, relatively gas-impervious orifices in a bushing. The attenuated stream of glass is thereafter directed into a cooling medium that attenuates the molten glass to form a plurality of thin filaments. The filaments are then typically gathered into a strand or onto a yarn package, and the assembled yarn packages wound onto yarn packages are used as reinforcement in plastic matrix products. In making glass fibers that are used as reinforcement in plastic matrix products, it is desirable that the glass fibers have a smooth skin or sheath, and, in particular, the portions of the sheath at the orifices. Prior attempts to improve the smoothness of the skin include (1) using a gas which moves away from the orifices during attenuation; (2) using a longer fiber-forming region and/or more glass-to-air interfaces; and (3) controlling the process to obtain a high percent of fume, i.e. to increase the percent of the orifices that are closed. However, these attempts are not entirely satisfactory because of the nature of the gas flow or the amount of glass that is produced in the area of the orifices which collect fume and, thus, generate problems in the formed product. Thus, there is still a need for glass fiber-forming processes that produce more suitable glass fibers with a decreased coefficient of friction that can be used in reinforcing plastic matrix products.package cn.anline.annarchitecture.kaptcha; import android.content.Context; import android.content.DialogInterface; import android.content.DialogInterface.OnClickListener; import android.content.SharedPreferences; import android.preference.PreferenceManager; import android.widget.ImageView; import cn.anline.annarchitecture.BuildConfig; import cn.anline.annarchitecture.R; import cn.anline.annarchitecture.kaptcha.util.FingerPrintManagerUtil; import cn
