XREF database is an XML file or XRef database (XRDB) file that contains references to other drawings and parts, or just to other files in the same drawing. XREFs (Autodesk 3D DWG XML Reference Files) are one of the main features of AutoCAD Cracked Version DWG, and are now available in the default files that have been created by Autodesk. The XREF database is a separate file in a Drawings folder in the AutoCAD folder. In the XREF database, the drawing's drawing number is a XREF code, or AXREF code. The XREF code is encoded into a filename, so that it is also readable as the filenames of drawings in other files. The XREF number is unique, and is the key to finding any referenced drawing in the file. how the program knows that "current" is the property name. I can put any name and it works, but I don't know the logic behind it. A: The Name property of an object (or anything for that matter) isn't just a string. It's a Name. In .Net, this is a type representing a name. In particular it's a property that can be used to query the Name type. In your particular case, the Name property of the property of your property, as it would be expressed in a Type object, is "current".
