KeyMACRO is an application that provides a special keystroke recorder that records all the keyboard activities on your computer, including the most difficult ones to be recorded. It is not recommended for use if you work in secret and require absolute anonymity, since the program makes it very easy for you to be identified. However, the program can be used to record the keystrokes of any other user who uses your PC, which may be helpful in finding his name or account password in order to avoid account theft or other malicious actions. The program also records mouse movements and other mouse clicks and you can activate it only when your mouse is in use, thus keeping your PC as silent as possible. KeyMACRO offers several modes of operation, the most common one being a simple keystroke recorder. To activate it, you should select the type of file you want to record from the drop-down menu in the main window. It provides support for text files, HTML files, image files, archive files and more. You can select the text to be recorded and the application will record everything typed, including passwords and the directory path. You can activate the recording only from the text area and the mouse area, but you can also specify the recording mode as to take place only when the mouse is in use or only when it is in use and the keys are pressed. The recording stops automatically when the mouse moves or you use any other function on the PC. If you select the image recording mode, the program automatically detects the Windows image to be recorded and plays it at the desired frame rate. You can choose the image type, the size and also the file format. You can also choose the record of mouse movement and mouse clicks. If you choose archive recording mode, the program detects the Windows archive file and plays it at the desired frame rate. You can choose the mode of compression as well as the level of compression. You can also select the option to launch the recording when the mouse moves or when it is in use and the keys are pressed. As mentioned earlier, KeyMACRO has a stealth mode that enables you to record the keys when your mouse moves or the keys are pressed. You can also choose whether the program should run in the background or turn the screen black when the recording is activated. Another feature of KeyMACRO is that it allows you to start the recording only from a specific time or date, which can be set by you. You can stop the recording using the stop command or pressing the escape key 77a5ca646e
