My dad's.Q: Understanding the implied multiplicity of a variety I'm having trouble understanding the text in Example 1.6.7 in Spivak's Calculus, by Richard S. Falk and Frederick R. Weinstein, Chapter 1. Therein, we are dealing with the variety V defined as follows: F has a real root if and only if $F(x)=0$ has a real root. (a) To compute the dimension of V: We compute the number of variables that occur in the equation $F(x)=0$. Since x occurs in both the x and y in the equation, and x appears only once in the equation, we have that y occurs 2 times. Because

F is polynomial of degree 2, it will not contain odd power of x or y. Since F contains xy, it follows that F will contain neither even nor odd powers of x. Thus y can not contain even powers, and y will only contain odd powers, and so we have that the degree of y is an odd number. The degree of y being odd implies that y will be monic, since the degree is positive. We want to compute the resultant. We will show that $F(x)F(y)=xyF(y^2+x^2)$, and thus, the resultant is y^3 plus some constant. We expand $F(x)F(y)$: $$xyF$ e79caf774b
