I'd like to know the number of threads for each detected process as well. Thanks, Minibat Hi Minibat, Well, DbgKit should be made to do this for each process overview listing, and this is being worked on. I know that there is a tool that does this called JTgui. It would be nice to combine KD and JTgui, by integrating the process overview view of KD with the generic threads and registers info JTgui

DbgKit [Win/Mac]

DbgKit is a complex piece of software aimed at developers and other users with advanced programming knowledge. It comes in the shape of a dynamic link library and aims to function as a GUI extension for the Windows Debugging tools. The utility comes with no instructions,

documentation or help file of any sorts, meaning users will need to rely on their experience in order to determine how to integrate the DLL file into their debugging tool of choice, be it WinDbg, KD, CDB, NTSD. DbgKit is meant to provide users with the ability to get a more structured view of the processes that are running on a system, organizing them hierarchically. In addition, it features a detailed set of data concerning each detected process. For each process, DbgKit informs users of the PID value, number of threads, the virtual size and the working set value, the handle count, as well as the full image path. In the case of 'Handles', the tool provides users with information about the entry type and its corresponding granted access, the attributes and other references. For 'Threads', users can learn the start address, start and exit times, as well as the elapsed duration. Its state is also visible, along with the wait reason. Other type of information provided by DbgKit concerns the 'Performance' data, 'Security attributes', 'Modules' and 'Environment' variables, and several more, which can come in handy when working with any of the popular Windows debugging tools.

DbgKit Description:
Hash implementation in C++ for MD5, SHA-1 and SHA-256. Can perform calculations on values in each of the calculated hash functions. Provides convenient methods for hashing, encrypting and verifying data and hash functions via an object-oriented design. Backends for each of the hash algorithms is integrated into a single object allowing implementation of secure hash functions in forms of static libraries. Hash32 is an efficient and secure general-purpose hash function for 32 bit integers. Hash32 is based on a wide array of weaknesses and exploits in various hash functions. Hash32 is an object-oriented and secure hash function, it offers performance best that out-performs all of the widely used hash functions. The goal of hashing operations using Hash32 is to offer the same "good" and "fast" security properties that the widely used hash functions
