In addition to creating and editing drawings (geometric shapes and lines) and drafting views (optical and dimensional views), AutoCAD is capable of designing mechanical and electrical engineering components, laying out schematics, and performing print shop, web and mobile app design, animation and rendering. This article is based on experience with AutoCAD 2016 and prior versions. Check out the links at the bottom of this page for more AutoCAD information. Figure 1: After importing a drawing into AutoCAD 2016 (top), new tools can be selected to create a cut list (bottom). 1. Importing and Exporting One of the key strengths of AutoCAD is its ability to import and export drawings in a variety of file formats. The.DWG (drawing) file format is the most commonly used CAD file format for AutoCAD because it's a highly portable format. The file can also be saved as a native.DXF (drawing exchange format) file. Both of these file formats are used in the construction industry. Figure 2 shows how to open and close a DWG or DXF file from within AutoCAD. Figure 2: File formats supported by AutoCAD include DWG (top), DXF (bottom left) and SVG (bottom right). 2. Hiding It's easy to create new layers or objects by selecting them and pressing the H key (Figure 3). When the layers are arranged from top to bottom, they are referred to as "viewports." The same key opens the tool palette, allowing you to select any of the tools available for a particular layer. For example, you can hide a layer by selecting it and pressing the H key. You can also hide the entire drawing. Figure 3: Press the H key to hide a selected layer (top) or the entire drawing (bottom). 3. Hidden Layers When you create a new layer in AutoCAD, it can be added to the active drawing (Figure 4). The active layer is the layer that will show through when you use the ALT+ENTER shortcut to exit edit mode. However, you can choose to hide this layer and show a different one. Figure 4: To show a hidden layer, select it and press the ALT key (top). To hide a layer, select it and press the H key (bottom). Note: You can also hide layers by selecting them

A judgement of social distance (JSD) is a commonly used method of studying intergroup behaviour. We investigate the effects of the source and type of information provided in a typical JSD procedure. Subjects (n=50) first received general information about the target group (the handicapped) and then information about the target group in an additional condition, and they then judged the acceptability of interacting with the target group in a further condition. It was found that a source-of-information effect appeared when the information was general, but not when the information was specific. af5dca3d97

In particular I would like to do the following test: URL url = new URL(""); url = null; url.getClass() == URL.class However TestNG can't seem to handle that properly. As a result if I do the following: URL url = new URL(""); url.getClass() == URL.class url = null; It will throw an exception and I'm pretty sure it is because URL.class is an abstract class. I was wondering if anyone knows how to test java.net.URLs in TestNG. Thanks. A: As the JavaDoc says, URL's are abstract and you have to provide an implementation for the getClass() method. Use one of the following: RealURL class from java.net.URL URLStreamHandler class from java.net.URL All classes listed in the JavaDoc are non-abstract and can be directly instantiated.
