Concepts Autodesk
introduced the concept
of 3D design in 1982 with
the introduction of
AutoCAD. In general,
Autodesk's AutoCAD and
other CAD programs

support designing in the context of a three-dimensional (3D) model of an assembly of objects. A 2D drawing is considered a 2D representation of a 3D object. A drawing is a representation that shows how the objects are to be combined to create an assembly. A component can be: A

building block An
assembly component An
assembly A stand-alone
object To construct a 3D
model, a user defines
several geometry
components that form
the parts of a 3D model.
These components
include: Curves, lines,
and arcs that describe
the contour of an object
Nurbs, which is used to

create freeform surfaces
and to create
mathematical surfaces
(e.g., to define the roof
of a building) Surfaces
(2D shapes) that define
the boundaries of an
object Polylines, which
are used to show planar
surfaces Polygons, which
are used to describe
complex geometry
Bounding volumes

Mechanics An outline of an object is usually defined in terms of a mathematical equation to determine the shape of the object. The equation is called a "mechanics" or "movement" equation. In earlier AutoCAD releases, mechanics equations were used for two purposes: To help the

user see where and how
an object is rotated To
help the user edit the
object to make it
freeform, or nonplanar,
or non-orthogonal For
example, if you make a
circle, and you set the
Radius

AutoCAD Crack+ [Updated]

Features Model tools

Under the menus Tools → Modify → Model, features can be selected and edited. Toolbars AutoCAD can be customized in a number of ways. Customization can be accomplished through the Tools → Customize → Toolbars menu or using the Toolbars window. Once customizations have

been made, they can be saved in the Personalization Editor and subsequently edited at any time by using the Tools → Personalization Editor. Drafting AutoCAD has many features for working with the drafting space. Entities Entity types are set by default by an "Entity" option, and objects are created

by dragging onto an entity. The entity sets the object type, and displays the appearance of the object in the drawing space. The type of entity can be selected by clicking the type of entity on the drawing space, while a selection is made. The selection will be made in the Entity Type field in the Entity

Inspector. Objects can also be created through use of the Entity bar, by drag-and-dropping a table with the required object types onto the bar. Features Drafting features Highlight Mode Highlight mode is a feature that enables the tool or entity to be selected with the mouse, with the selection being

temporarily highlighted on the drawing space. The highlighting of the tool is lost when the mouse button is released, or when other highlighting tools are activated. The tool will no longer be highlighted if the user releases the mouse button after it has been activated.

AutoSweep AutoSweep

allows the user to indicate a path of either a rectangle, polyline, or spline. The system will attempt to create a closed curve between all the waypoints specified.

The curve should automatically follow the shortest path between the specified points. To create a closed curve, the user needs to first

select the type of curve that he wants to create.

Once this is done, the user needs to select the points he wants the curve to go through.

Levels of detail In AutoCAD, levels of detail, also known as Z-levels, are a feature of the model that determines how detailed a view should be when viewed

in certain viewports, such as "Wireframe" or "Print Layout". When set at "Top", a level of detail will show the highest level of detail as possible. If the level is set to "Bottom", it will show the lowest level of detail. af5dca3d97

What's New In?

Laser scan the quick and fast-and-easy way. With

automatic detection and accurate placement.

(video: 1:18 min.) Export to AutoLISP: Thanks to the new editor, you can import LISP source files to AutoCAD, and export from AutoCAD to LISP files with one click.

(video: 1:48 min.)

Reinventing ergonomics and more: Search bars: simply type what you are

looking for in the search bar. For example, type “Pentel” to find all Pentel pens in your drawing or type “Olin” to find all Olin pencils. (video: 1:29 min.) Optionally choose the color of the search bar by opening the Draw option and choosing to “Set color for search bar.” Now you can quickly find the most

important objects in your drawing. (video: 1:15 min.) Improvements to dimension bars: Dimension bars now include information about the size of the dimension text as well as the size of the dimension. The size of the text is now displayed inside the dimension bar. (video: 1:43 min.) Find all

objects from the
Navigation Bar: You now
can find all objects that
you have imported to
your drawing from the
Navigation Bar. Now you
can find the object you
need quickly without
searching through all the
pages of your drawing.
Faster command finding:
Improvements to the
help system: Search for

existing command names in the Help system. More help search results: Access help topic information directly from the command panel or from the help menu. Search the help system: The Help system now provides a search box for finding help topics and pages. Other new

features: Undo and redo options are now available when importing XML files: When you import an XML file, you can now undo or redo any changes you made to your drawing. Undo and redo of imported data: Use the “Undo” and “Redo” commands to change any imported data. Export all changes

to a new drawing: Export all changes to a new drawing, including past changes and undo and redo changes. Place option to place objects in
