Modules AutoCAD Crack is structured into modules. A module is a complete area of functionality (software or data), containing

all the functions, variables, and parameters associated with that area. Modules are usually contained within one file. A module may contain one or more dialogs or sheets. A sheet is a form to be filled out by the user or application. A module may have one or more drawing templates. Drawing templates are used by AutoCAD to generate drawing instances based on the current drawing content. Drawing templates are used to provide a standard (set of) output for a given drawing content. A module may have a set of events. An event can be triggered either in an application or a drawing, and may modify the state of AutoCAD or the drawing content itself. For example, an event can be triggered when the user is

editing a drawing, or when a drawing property is changed. An event may be configured to prevent execution, or be constrained to prevent action. An event may be registered (listen to) and be triggered by another event. There are 3 types of modules: A module for the user interface (UI) A module for the drawing engine and design center (DDTC) A module for a database such as the database for the drawing template. A module may use one or more of the following: data types: basic data types such as integer, float and string drawing editors drawing templates drawing operations commands and programs rendering capabilities rulers, guides, and properties dimensions grid options object libraries properties There

are two types of drawer modules: A module for data input A module for data output A module may support a model database. A model database is a database that stores model data: the design of the model represented by the data. This includes data such as surfaces, polylines, splines and objects. A module may be directly associated with a drawing A module may be shared between two or more drawings Some modules, for example the UI, may be shared between all drawings that use the module, and these are said to be drawing-local modules. Modules may support a library of drawing commands Modules may have multiple different forms Sheet form Sheets have two different types of forms: the edit

form and the print form. These two forms
