Tally ERP user manual The CDC's FFT method is similar to that of the Parseval's theorem, which only uses the square of the Fourier coefficients: How do these two expressions differ in each case? A: The Fourier coefficients are the complex coefficients of the Fourier series decomposition for f and its even and odd parts. For the first formula, use the Parseval's identity $\sum_{-N}^N a_n \overline{a_n} = \sum_{-\infty}^{\infty} |a_n|^2$. The Fourier series of f can be written as $\sum_k a_k \mathrm{e}^{\mathrm{i} k \omega}$ where $a_k = \frac{2}{\pi} \int_{-\pi}^{\pi} f \mathrm{e}^{\mathrm{i} k \omega} \mathrm{d}$

ω . The last expression is the Fourier transform of the square of f . For this to make sense, we need some additional conditions on f . For instance, you have $f \in L^2$. For the second formula, use the Parseval's identity again $\sum_{-N}^N \overline{a_n} a_n = \sum_{-\infty}^{\infty} |a_n|^2$. The Fourier series of f can be written as $\sum_k b_k \mathrm{e}^{i k \omega}$ where $b_k = \frac{2}{\pi} \int_{-\pi}^{\pi} f \mathrm{e}^{-i k \omega} \mathrm{d}\omega$. Now, we square $\sum_k b_k \mathrm{e}^{i k \omega}$. The Parseval's identity tells us that this is equal to the square of the L^2 inner product of the functions f and 1 : $\sum_k \overline{b_k} b_k = \int_{-\pi}^{\pi} |f|^2 \mathrm{d}\omega$.
