The presence of familial Creutzfeldt-Jakob disease (CJD) is associated with the almost exclusive non-European genetic background of the first case. In the United Kingdom, the association of familial CJD with this unique genetic background is exceptional. It is possible that either the frequency of familial CJD in Europe has remained largely unaltered, or that the incidence of this disease has declined through the largely endemically-acquired dominance of the sporadic form of CJD. We describe a family in which the diagnosis of classical CJD occurred in a non-European individual whose father died of Alzheimer's disease. A single-injection technique for measuring iodine deficiency in milk-fed, nursing, children. Single-milk-sample spot-urine iodine determination is a reliable method for identifying the severity of iodine deficiency in milk-fed children. It is easy to perform, accurate, quick, and specific. The method may be used to select areas for expanded iodization and/or monitoring of existing programs. Iodine values from milk samples collected from a sample population of lactating women, following liquid milk alone or milk with a supplementary iodine tablet, were used to estimate iodine intake in infants. The variability of spot-urine and milk iodine values depended on the level of iodine in the sample population studied. Iodine deficiency was confirmed in one village in 1-2-year-old infants despite a consistent milk supply from a local creche. Spot-urine iodine measurements in milk-fed children can be used to estimate the iodine status of a population. Solving the Impasse in African AIDS Care: US Experience This article will briefly consider the inter-relationship between Africa and the United States and highlight the US experience in addressing the impasse in African AIDS care. Uganda, South Africa, and Nigeria are among the countries that are well-known for high incidence of HIV/AIDS infection among the general population. In the context of US HIV prevention and treatment programs, some of the HIV prevention activities involve using condoms, abstinence, and related approaches. What is striking is that not long after the advent of medication to treat HIV infection (AZT in 1987) some 4-5 years later, at the same time that the US Government was contemplating a massive change in the 'Big Picture'

I know some of the online journals are not as frequent in the field I want to work in, but I know some of them are. I want to know where to get journals in my field of study. I am so new to this research thing. A: Get started at my Department's research portal: It should have a table of relevant journals. Acidic phospholipase A2-induced cleavage of myocardial phosphatidylcholine: a clue to the role of phospholipase A2 in the

pathogenesis of ischemic/reperfusion myocardium. Phospholipase A2 (PLA2) is thought to be a strong contributor to the cellular damage after ischemia/reperfusion (I/R) of the heart. We have analyzed the cleavage pattern of phosphatidylcholine (PtdCho) upon simulated I/R in the rat heart. I/R resulted in a characteristic increase of endogenous basal PLA2 activity, determined by radiolabeled fatty acid release from PtdCho. Low molecular weight PLA2 activity increased only after 3 h of reperfusion and decreased thereafter. Cardiac PtdCho hydrolysis started at 4 min of reperfusion and increased during the subsequent time. Trinitrobenzenesulfonic acid treatment inhibited the increase of PLA2 activity and PtdCho cleavage. Hydrolysis of PtdCho from subcellular membranes of reperfused myocardial tissue revealed a characteristic fragmentation pattern of PtdCho. PtdCho from different subcellular organelles was hydrolyzed to different extents. The major product formed upon cleavage of PtdCho from microsomal membranes was phosphatidylethanolamine, indicating that PtdCho hydrolysis was initiated at the level of the inner monolayer of the phospholipid bilayer by acidic PLA2. Extraction experiments suggested 6d1f23a050
