Field of the Invention The present invention relates to a circuit which efficiently detects the dielectric polarization state of a capacitor and a method of detecting the dielectric polarization state of a capacitor using the same, and more particularly, to a circuit which efficiently detects the dielectric polarization state of a capacitor having a low capacitance and

a method of detecting the dielectric polarization state of a capacitor using the same. 2. Description of the Prior Art Generally, a capacitor having a low capacitance can be easily implemented by using a well-known circuit design. FIG. 1 is a circuit diagram of a conventional capacitor detection circuit. The capacitor detection circuit according to the prior art is adapted to detect a capacitor having a low capacitance, wherein the capacitor is driven by a voltage source V. The capacitor detection circuit according to the prior art includes a voltage-to-current (V/I) converting circuit 20, a reference resistor Rr, an integration capacitor Cr, a sampling capacitor Cs, and a control switch 22. The voltage-to-

current (V/I) converting circuit 20 is connected between the node A and the ground G. The node A is connected to the switching terminal of the sampling capacitor Cs. The reference resistor Rr is connected between the node A and the reference voltage Vref. The reference resistor Rr determines the voltage dividing ratio in the V/I converting circuit 20 and a threshold voltage Vth is thus obtained. The integration capacitor Cr is connected between the node A and the control terminal of the control switch 22. The control switch 22 is connected between the node A and the voltage source V. The control switch 22 is switched in response to 6d1f23a050
