Compressed (.zip) 18.2K. 1.9.1673.zip. 5-20-08. 20:59:29.Stereotactic biopsy is a method for obtaining a sample of tissue from within the body by inserting a hollow needle, having an inner stylet, through the skin and into the body. A stylet is located in the needle lumen, which is typically three to twenty-two centimeters long and may range in diameter from 0.05 millimeters to over 0.5 millimeters. The stylet is retracted within the needle lumen, and the needle, carrying the stylet, is rotated such that a tissue sample may be taken. The tissue is sampled by placing the stylet in a tissue mass, and either pushing on the stylet to cut the tissue sample and withdraw it into the needle lumen, or by grasping the stylet in the operator's hand and then pulling the tissue sample from the needle lumen. Since the needle is typically inserted with the stylet retracted into the needle lumen, the needle is introduced through the tissue and into the body, typically, through the skin, which may be located on the chest, the abdomen, the hip, or a joint such as the shoulder or knee. The movements to rotate the needle and insert the needle into the body are repeated until a sample of tissue is obtained. Prior art biopsy devices include those disclosed in United States c6a93da74d
