
Win32com Dll Javax Comm
Properties Comm Jar __HOT__

[Download](#)

The tox application, under the sample directory, is a sample program that demonstrates the use of RS-232 communication and communication port. The tox application simulates the RS-232 communication by transmitting and receiving data using Win32's DosKeyb. i face 2 problems.. first is when i launch the server the gateway does not launch i get Exception in thread main

org.smslib.GatewayException: Comm
library exception:
java.lang.RuntimeException:
javax.comm.NoSuchPortException hi, forgot
to ask, did u configure JVM on your machine
as I have noted in the post. Thats
necessary for this case. >

Win32com Dll Javax Comm Properties Comm Jar

i have installed the 32bit java version and
have run a test program which calls the
parse method as explained in the javadoc
for this api. the output was a
java.net.connectexception which indicates
that the comm api is not installed. replace
xxxx with the name of your program.
alternatively, you can use environment.get
systemproperty("java.library.path"); to see
what the class path is, and add the paths
from there to the java class path, but that's
not the same thing. that's a product-

specific setting, so if you're running under windows, you can't use that setting to make your program talk to a comm port from anywhere else. and even if you did, you wouldn't be able to use that setting to make the java library path available to any other java programs, since those programs would also be looking for lib files in their own java folders. i didn't know that. i was trying to work around it by using jni to write a wrapper class that would construct an inputstream and then write a byte stream to a socket. the socket classes in native look pretty similar to commport, so i figured they had a toinputstream method. i tried that and it hung. :- (i made a copy of the native classes and put them in my own project, hoping to debug them. another hang. hmmm..) when i deploy the comm.jar, it does not work. it must be installed in the ext directory of the jre. i put the comm.jar in a directory

jre/ext/win32/com/win32com/javax/comm
and the jre/lib/javax.comm.properties in a
directory jre/lib. when i then run my midlet
under web start, it does not find any
physical com ports. what am i doing wrong?
any hints? 5ec8ef588b
