In 4 patients the authors describe post mortem findings (traumatic autopsy, autopsy without a post mortem examination) and the difficulties arising from the finding that in all cases fatal infections with B3/B4-pneumococci (pneumococcus 4c) could be diagnosed later than the respective clinical outcome. The first case shows that B3/B4-pneumococci with genetic homology to 4c can cause fatal infection. The second case shows that B3/B4-pneumococci with nucleotide sequence homology to 4c can cause a diagnostic error. The third case shows the possibility of misdiagnosing fatal infections with B3/B4-pneumococci, containing the heterogenous gene sequence of 4c, as infections with B1-serotypes. The fourth case shows the possible non-committalness of the CD-test for B3/B4-pneumococci in bacteriologically false negative cases. The impact of population growth and of urbanisation on biodiversity: a review. "The effect of population growth and urbanisation on flora diversity is analysed with respect to the amount of habitat loss in recent centuries. Due to the growing demand of capitalistic economy and the increasing construction of urban and suburban habitats, a greater human pressure is put on ecosystems worldwide. It is estimated that species richness can be reduced to half of its initial level. Urban planning should be based on a view of nature that enhances biodiversity rather than destroys it. During the last decades an increase of experimental research has come into focus with the aim to predict the impact of this human activity on flora diversity." [Selective serotonin reuptake inhibitors and neurodevelopment]. Selective serotonin reuptake inhibitors (SSRI) are the most commonly prescribed drugs of mental disorders. The guidelines of the German Association for Psychiatry and Psychotherapy (DGPPN) and the United States Food and Drug Administration recommend to use SSRI at the beginning of the psychotherapeutic and psychopharmacological treatment in the psychiatric disorders with the exception of depression. In case of non-response of depression within a few weeks, in particular in

children, therapy with a new antidepressant should be initiated. SSRIs are the best established drug family for the treatment of depression. Regarding the potential of psychopharmacology, neurodevelopmental aspects of SSRI are becoming more and more evident. There are interesting data on the hypothesis that SSRI have toxic effects on progeny by inhibiting serotonin transporters of fibroblasts. The central nervous system itself might also be affected by these drugs. In summary, SSRI are a widely-used drug family but there is still a lot to investigate regarding the toxicology of these drugs. 5ec8ef588b
