

7000+ users Easy-to-use Professional and well-designed interface Among the many features is the capability of measuring and storing lengths in pixels. View full description Moderately high thyroid function increases the risk of first-ever stroke in middle-aged and elderly individuals: the SHIP cohort study. Thyroid function has been associated with stroke risk in several cross-sectional studies, but prospective studies are lacking. We investigated whether moderately high thyroid function increases the risk of stroke. In the population-based cohort study "Studying Health in Pomerania" (SHIP), high, normal and mildly low TSH were compared in 853 first-ever stroke cases and 4207 controls (1987-2009). The hazard ratios (HR) of stroke for mildly low TSH versus high TSH were 1.33 (0.90-1.96) and 1.17 (0.85-1.63) in women and men, respectively. The HR of women with high TSH was 0.64 (0.45-0.90) versus mildly low TSH (p-trend=0.0005). The risk of stroke was strongly modified by the presence of hypertension, diabetes, myocardial infarction, ischemic heart disease, atrial fibrillation, smoking, statin use and heart failure. The stroke risk in subjects with moderately high TSH was only slightly increased after adjusting for these confounders. High TSH was strongly associated with the risk of first-ever stroke in women and moderately increased stroke risk in the presence of other stroke risk factors. [The effect of emoxypine (Molip-dex) on the lipid metabolism and cardiovascular system]. A study was made of the effect of emoxypine (moliprol, Molip-dex) on the lipid metabolism and some hemodynamic parameters in healthy subjects and patients with hyperlipidemia. The drug (the basic component of the antiphlogistic agent Molip-dex) was found to normalize the lipid metabolism and to improve the rheological properties of the blood, decrease the platelet aggregation. The drug was found to exert a cardio-vascularolytic action on the healthy subjects and on patients with hyperlipidemia.
