Adobe Photoshop Lightroom is only available for Microsoft Windows. Lightroom CC is available on macOS, so in theory, you ought to be able to use it on your MacBook, but something about Apple's dynamic, binary file system won't allow Asana to write to the desktop directory (located in a hidden folder) and thus prohibit Lightroom from being accessed. This is not simply something that you can "fix" later; if you are serious about using Lightroom anywhere but your desktop computer, you should look into this problem. The Adobe-hosted, online photo-management service, known as Lightroom , long served as the standard for the art director or photographer on the cutting room floor; Photoshop lacked the requisite features, and the other well-respected services upstarted at the same time, including Kodak EasyShare. For years the number-one reason for Lightroom's lack of popularity has been its $200 price tag, and yet lesser-known alternatives are commonly available for only a fraction of that fee. In other words, the price of Lightroom was never appropriate for anyone but the semi-technical. The fact that Lightroom is a desktop application, in order to recognize non-Windows operating systems, is a big hole not just in Lightroom's mission but in Adobe's marketing approach as well. Now, though, Lightroom lets you manage photos online, through the reference design. It's certainly less comprehensive than the desktop version, and its staging-only steps, including the possibility of "global" color adjustments that affect not just photos but their associated metadata, are not quite perfect, but once again, the real strength of Lightroom is its integration with other applications.
