

Emsa Advanced Port Blocker Crack Product Key Full Download

Emsa Advanced Port Blocker Crack Torrent (Activation Code) [32|64bit]

Emsa Advanced Port Blocker Crack Mac (aka Emsa Advanced Port Manager) is a port monitoring software that enables you to block selected local and/or remote ports or even hostnames. By means of the application, you can easily log all network activity, control the connection status and define complex blocking rules. The main task of the program is to display all active connections to the user. The list of active connections can be filtered, sorted and exported to a CSV or TXT file. Once you have started the program, the first thing that the user sees is the "Connections" tab. This tab lists all active connections as well as local and remote ports, IP address, hostname, process ID and process name. You can also assign an application to a specific process, choose to monitor all local or remote ports and exclude detected IP addresses from the readings. Moreover, you can even filter the active connections by a given criteria (e.g. specific protocols, hostnames, etc.) or by an IP address range. All network activity is logged, and you can specify whether new log files should be generated every day, or disable them completely. You can also specify the type of connection (e.g. HTTP, FTP, etc.) or its port (e.g. 80, 22, 9999, etc.). Additionally, you can easily choose to block a specific host, add an IP address to an exceptions list and even block any new connections while keeping the existing ones active. The application's GUI is extremely easy to use and is also very user friendly. All the controls can be accessed via tabs and sub-tabs, and there are a few links on the tab for an overview of the settings. Once you start the program, the first tab you see is called "Connections". This tab is where all active connections as well as local and remote ports are listed. It also shows the hostname, process ID and process name. You can sort the connections list by clicking on the column headers (i.e. by local port, remote port, local IP, remote IP, hostname, process ID and process name) or right-click on the column headers and choose a column sorting method (i.e. ascending, descending, first, etc.). You can also filter the connections list (for example, by choosing to display only connections to a specific host or IP range) or you can export the connections list to a CSV or TXT file. If you click on the Settings tab,
