PC Magazine 2/13 cover story states that Adobe: "offered a glowing review of Lightroom - a'revolutionary photo editing software' with a wide variety of features and'superior speed'. The magazine devotes a full three-page spread to the software, explaining how it'mimics the brain's pattern matching abilities' and how it can be used to edit both still and moving images. Clearly enthused by Lightroom's capabilities, the magazine states that 'Lightroom is one image editing application that has no equal - it's not that Lightroom is better than Photoshop precisely - it's that its quirks, ergonomics, and workflow make it superior to Photoshop in every way possible'." The third page of the review is titled "Lightroom™ and Photoshop" and is an exclusive interview with Adobe representatives. In it, as they said, they claim that "In the course of the last several years, that product has become one of the most successful and profitable products in the Adobe family. It's got a huge following of filmmakers, a great database and channel of libraries, 20,000 advertisements on the companys web site, and more than 3 million downloads." I've been using Elements for a while now, going back to the CS4 days. I've tested the iPad version back then, and I recall not being pleased with it. Back then, Elements could take upwards of 15 minutes to do basic edits on a moderately-sized image (trying to process and do a basic retouch by hand). It could be frustrating waiting for it to do anything. I'm not sure why else I hadn't rushed to get the program. Now though there's no more waiting. It's interesting that it's correct to say it's been "on the market" for a while now. It's been a very long time.

A person who is aiming to become a designer must first be familiar with Photoshop. Especially in a digital world where internet is everywhere, Photoshop is the most popular program for designers and architects to create custom websites, logos, and advertisements. The problem is that no one can

visualize a million pixels, let alone the gigabytes of photos and graphic files you'll be working with. So, instead of dealing with a million pixels, you start with a much smaller set of well-considered and carefully chosen ones and then refine and reorganize them to create a masterpiece. But how do you select which pixels to use and how do you choose which colors to use? The creative process involves the use of color tools, channels, and selections to perform your work. Adopting a color-centric approach to your workflow means planning and scheduling your workflow so that you color correctly. Moreover, you begin with the right color palette for the project and broadens your vision as you develop your work. The goal is to become a better artist by becoming a master colorist. PhotoShop is just that—an editing and organizing program. It has no visual aesthetic, so its success is not judged by how beautiful it looks on the screen. In fact, it was designed to look the way it does so that we could easily discern the individual elements that make up a picture. Don't get me wrong—it's an incredible program for the creative types who want to really play around with the design elements of their photos and make them more visually appealing. (Keep in mind, though, that all of the photos on this website, on the pages for each individual tutorial, and many others were edited in Photoshop.) But if all you want to do is fix the shot—especially if you're recovering old photos—then, yes, Photoshop is the program you want to be using. e3d0a04c9c
